SUMMARY

Presbyopia Correction Device general has two types corneal inlay and Scleral Implants. A corneal inlay (also called an intracorneal implant) is a device which is surgically implanted in the cornea of the eye as a treatment for presbyopia. Successful installation results in reducing dependence on reading glasses, so that the user can more easily engage in everyday tasks such as using a mobile phone, reading store shelf prices and working on a computer. Corneal inlays are small, thin, and permeable. Typically one is implanted in the non-dominant eye. Scleral Implants are precision-molded from a clear plastic material; the clear implants are about the size of a grain of rice and are placed just below the surface of the white of your eye (called the sclera). The only one commercially available is VisAbility Micro-Insert System. The global Presbyopia Correction Device market will reach xxx Million USD in 2020 with CAGR xx% 2020-2025. The main contents of the report including:
