SUMMARY

Level measurement technology is widely used across many sectors such as construction, industrial, manufacturing, oil and gas, among others. Radar level measurement technology is categorized on the basis of type as non-contacting transmitter and a contacting transmitter. Radar level measurement is based on calculation of time required for completion of trip between the transducer and sensed material level. Radar level transmitters are ideally used for harsh environment where dust, vapor, or a foaming surface prevents the usage of ultrasonic measurement. The radar level transmitters are used for liquids, solids, or interface application. Based on the type of radar, further classification can be done as FM-CW radar, guided wave, CW radar, and pulse radar depending on the respective applications. Radar level measurement technology relies on “echo” signal which is reflected back from the surface. Thus, radar level transmitters provide accurate and reliable results for any liquids and solids under high pressures and temperatures.

The global Radar Level Transmitters market will reach xxx Million USD in 2020 with CAGR xx% 2020-2025. The main contents of the report including:
