SUMMARY

Respiratory humidification is a process of warming, purification, and humidification of the respiratory gas artificially. The lung tissues start getting damaged due to dryness of the organs when the natural humidification fails. Thus, respiratory humidification is carried out for mechanically ventilated patients. An artificial respiration causes the epithelial mucus layer to become more viscous in a short time, impairing the ciliary function inside the nose. Thus to prevent such complications, the loss of heat and moisture are compensated by the humidification process. The humid air is provided to the nasal mucosa at 37 degrees Celsius (room temperature), with adjusted 100% relative humidity to maintain mucociliary clearance for long time.
