SUMMARY

Roller Bearings are a type of rolling-element bearing that uses cylinders (rollers) to maintain the separation between the moving parts of the bearing (as opposed to using balls as the rolling element). The purpose of a roller bearing is to reduce rotational friction and support radial and axial loads. Compared to ball bearings, roller bearings can support heavy radial loads and limited axial loads (parallel to the shaft).

The global Roller Bearing market will reach Volume Million USD in 2017 with CAGR xx% 2018-2025. The main contents of the report including:
