## Abstracts

HNY Research projects that the Marine Seismic Equipment and Acquisition market size will grow from XX Million in 2017 to XX Million by 2023, at an estimated CAGR of XX %. The base year considered for the study is 2017, and the market size is projected from 2018 to 2023.

Marine seismic surveys are carried out to generate subsea bottom profiles for industries such as oil & gas, energy, and construction. This type of surveying is conducted by generating mechanical sound waves that are sent into the earth. The energy reflected back from the earth is measured by recording sensors. The marine seismic operations require various equipments such as seismic sensors, streamers, geophones, hydrophones, energy sources (air/water gun), streamers and sub-bottom profilers. A seismic source creates an acoustic signal in the water. These signals penetrate into the seabed, and are reflected back to the seismic sensors. Further, these sensors measure seismic vibrations by converting ground motion into a measurable electronic signal. These recorded signals are then subjected further for processing and interpretation to yield comprehensible information about the subsea surface.
