## Abstracts

The global Concrete Cooling market was valued at 982.49 Million USD in 2021 and will grow with a CAGR of 3.03% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Concrete cooling is a technique that reduces the temperature of poured concrete to a certain level, in order to guarantee the quality of the concrete. Concrete cooling is mainly used for projects in parts of the world with warm climates, where large amounts of concrete are used. When concrete cures, a minimum favorable temperature in the range of 10 - 21 °C must be maintained in the concrete for the minimum required curing period. If it cures at temperatures above this level the concrete loses strength, more cracking occurs, it rapidly sets and there is an increased water demand. Therefore, the importance of concrete cooling is huge, especially considering the crucial role concrete plays in almost every building process. Among all applications, highway construction holds the largest market share, in terms of value, as of 2017. Concrete cooling systems are ideal for regions that have a warm climate. Due to this, demand from the Middle East region is the highest. The various applications of concrete cooling use these solutions to cure concrete which would help improve strength of concrete in the long-term, thus making the structure strong enough to last for years after construction. Thus, this would lead to an increase in the demand for concrete cooling solutions in the

highway construction application segment.
