Prebiotics are fibers which cannot be absorbed or broken down by the body and therefore serve as a great food source for probiotics, in particular the Bifidobacteria genus, to increase in numbers. Prebiotics by nature do not stimulate the growth of bad bacteria or other pathogens; the official definition of prebiotics is: 'non-digestible food ingredients that beneficially affect the host by selectively stimulating the growth and/or activity of one or a limited number of bacteria in the colon, which can improve host health.' Prebiotics and probiotics are easily confused. Not only are the names similar, but they are both related to the good bacteria we all need to maintain good digestive health. However, that's where the similarity ends. Probiotics is the name given to the range of good bacteria naturally present in the gut. These help the digestive system function properly. Some Probiotics are present in food such as yoghurt, and these may, or may not, make it through the digestive system to the large bowel. Prebiotics pass through the stomach to feed the good bacteria in a child's gut, supporting their natural immune system. Prebiotics work naturally from within to encourage the growth of good bacteria which support the digestive and immune systems in developing babies. In this

report, we only include prebiotics.
