The global Acidic Colloidal Silica market was valued at 73.78 Million USD in 2021 and will grow with a CAGR of 4.4% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Colloidal silica is silica particles that are suspended in a liquid. The liquid is denser than water and has been stabilized electrostatically to allow the particles to stay suspended in the solution. The silica particles are also very small and do not have a large density. If the particles are too large, they will settle out of the solution. If the silica particles are too small, they are difficult to stabilize in a solution. Colloidal silica is not only available in bulk deliveries, but also in plastic drums and IBCs. The pure silica sols are anionic and are typically sodium- or ammonium-stabilized to a pH of 9-11. Through modification using sodium aluminate, however, the sols are stable down to a pH of 3-4. Cationic silica sols are stable at pH 4-5, and deionized sols are stable at a low pH, typically 2-3. From the different types of acidic colloidal silica, the particle size 10-20 nm type held the maximum market share with over 63% in 2019. From the perspective of applications, the catalysts took the first place with 42% market share in 2019, while textile industry occupied 22% of the market share.
