Adrenoleukodystrophy (ALD) is a rare, genetic, X-linked metabolic disorder caused by mutations in the ABCD1 gene that result in a deficiency in a peroxisomal protein called adrenoleukodystrophy protein (ALDP). Adrenoleukodystrophy (ALD) is a disease linked to the X chromosome. It is a result of fatty acid buildup caused by the relevant enzymes not functioning properly, which then causes damage to the myelin sheath of the nerves, resulting in seizures and hyperactivity. Other symptoms include problems with speaking, listening, and understanding verbal instructions. There is currently no satisfactory therapeutic treatment available. Current treatments are limited, namely: Dietary therapy, Gene therapy, Hormone replacement and stem cell transplantation. Hormone replacement is standard for ALD patients demonstrating adrenal insufficiency. By region, North America has the highest share of revenue, exceeding 60 percent in 2019.
