Abstracts

The global Alpha 1 Antitrypsin Deficiency Treatment market was valued at 118.59 Million USD in 2021 and will grow with a CAGR of 10.23% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography (North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Severe deficiency of alpha-1 antitrypsin (AAT) can cause early-onset emphysema and several liver diseases, including cirrhosis, neonatal hepatitis and hepatocellular carcinoma. The discovery of the structure and function of the AAT protein and the subsequent isolation and purification thereof have made possible alternative therapies aimed at preventing the progression of related pulmonary diseases (so-called 'additional therapies'). The isolation of this gene and the advancement of gene therapy have further increased the possibility of specific treatment. Most specific treatments for AAT deficiency aim to increase plasma AAT levels (and thus elevated AAT concentrations in the interstitial lung) above the protection threshold. Other experimental therapeutic approaches attempt to interfere with the production of abnormal AAT proteins or to inhibit the polymerization of abnormal AAT proteins and to promote the secretion of AAT from hepatocytes. For patients with end-stage lung disease or liver disease, organ transplantation is another treatment option. Currently, the most direct and effective way to increase AAT levels in plasma and interstitial lung is by intravenous infusion of pooled alpha-1 antitrypsin (pAAT).
