Abstracts

The global Antimicrobial Susceptibility Test market was valued at 233.57 Million USD in 2021 and will grow with a CAGR of 5.99% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Antimicrobial Susceptibility Test is used to determine the sensitivity of the drug in order to accurately and effectively treat the drug. At present, the methods of drug susceptibility testing in clinical microbiology laboratories include paper diffusion method, dilution method (including agar and broth dilution method), antibiotic concentration gradient method (E-test method), and automated instruments. Antibacterial drugs play a very important role in the control of bacterial infectious diseases. However, due to the unscientific and blind abuse of antibacterial drugs in the breeding process, many pathogenic bacteria have developed drug resistance, making antibacterial drugs resistant to bacterial diseases. The control effect is getting worse and worse, which not only causes waste of drugs, but also delays the disease and causes great economic losses to the farmers.
