The global Aptamer market was valued at 32.78 Million USD in 2021 and will grow with a CAGR of 14.3% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Aptamers are a small segment of oligonucleotides screened in vitro and can be highly affinity and strong with the corresponding ligands. The combination of the opposite sex, its appearance provides a new research platform for high efficiency and fast recognition for the chemical and biomedical circles, and has shown good prospects in many aspects. Nucleic acid aptamers are highly specific and highly selective in combination with a variety of target substances and are therefore widely used in the field of biosensors. When a nucleic acid aptamer specifically binds to a target substance, the configuration of the nucleic acid aptamer itself changes. Researchers have applied nucleic acid aptamers to probes and developed many electrochemical sensors based on the configuration changes of nucleic acid aptamers, also known as E-AB (Electrochemical aptamer-based) sensors, combined with electrochemical detection methods. The E-AB sensor improves the application of nucleic acid aptamers in the sensor field because of its portability, simple operation and low cost.
