Polyacrylamide is an important class of water-soluble polymer, which is a general term for water-soluble polymer chemical products obtained by homopolymerization of acrylamide or copolymerization with other monomers. From the physical form of the product, it can be divided into powder granules (solid content of 90% or more), aqueous solution (solid content of 30% or less), oil emulsion and water-in-water emulsion (solid content 30%-60%), etc. Kind. Since the structural unit contains an amide group, it is easy to form a hydrogen bond, has good water solubility and high chemical activity, and is easily grafted or crosslinked to obtain various modifications of a branched or network structure, and polyacrylamide has Special physicochemical properties (such as adsorption, high viscosity, cross-linking), with thickening, dispersion, adhesion, flocculation, gelation, rheology control, high water absorption, reinforcement, film formation and other application properties.
