Abstracts

The global Artificial Heart market was valued at 18.44 Million USD in 2021 and will grow with a CAGR of 16.71% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Artificial hearts are being used to help patients with total heart failure live normal lives past their life expectancy time line, or to help patients survive until their transplant date either by replacing the heart completely or by replacing the ventricles. The device is surgically implanted in the chest in order to help in the functioning of a deteriorating heart. An artificial heart may also be used temporarily and is removed once the heart starts functioning normally. In cases where the damage is severe, the biological heart is completely replaced with the artificial heart. An artificial heart is powered by either compressed air or electricity. The rise in the number of cardiac disorders along with an increase in the geriatric population is anticipated to drive the artificial heart market in the coming years. Improper lifestyle, leading to deteriorating cardiac condition is expected to offer growth opportunities during the forecast period for the manufacturers of artificial heart.
