Assisted Walking Devices are designed for people who are suffering from leg injuries or are unable to walk due to any internal problem. These devices are also used by people who face the problem of body balance during walking due to nervous system diseases, such as Parkinson`s disease and Alzheimer disease. The chronic conditions prevalent among the elderly population have a detrimental impact on the musculoskeletal and neurological systems, which further causes walking disabilities among people. In 2015, North America held the maximum revenue share of nearly 39.58% on account of the presence of a large geriatric population in this region. The presence of advanced healthcare facilities and well-developed reimbursement policies are the key factors driving the Assisted Walking Device Market in this region. Moreover, the high prevalence of target diseases, such as arthritis, Parkinson`s disease, and other chronic disabilities in this region is expected to act as a high impact rendering driver for the market expansion over the next nine years. Furthermore, the availability of these mobility aids at subsidized rates for disabled patients is expected to propel this market over the forecast period.
