A Digital Signal Processor, or DSP, is a specialized microprocessor that has an architecture which is optimized for the fast operational needs of digital signal processing. A Digital Signal Processor (DSP) can process data in real time, making it ideal for applications that can't tolerate delays. A digital signal processor (DSP) is a specialized microprocessor (or a SIP block), with its Signals (perhaps from audio or video sensors) are constantly converted from analog to digital, manipulated digitally, and then converted back to analog. DSPs matter because they're an essential part of modern audio equipment, from headphones to DACs, automotive speakers, and professional equipment. A high-quality DSP will give you processing power for high-quality effects ranging from on-device EQs to voice recognition, active noise cancelation, and surround sound capabilities. Premium DSPs also require very little power, prolonging the battery life of your devices for longer listening. Global Audio Digital Signal Processor key players include TI, NXP Semiconductors, Analog Devices, ON Semiconductor, STMicroelectronics, etc. Global top five manufacturers hold a share over 45%. Asia-Pacific is the largest market, with a share about 75%, followed by North America and Europe, total have a share about 20 percent. In terms of product by Max
