A fire sprinkler or sprinkler head is the component of a fire sprinkler system that discharges water when the effects of a fire have been detected, such as when a predetermined temperature has been exceeded. Automatic fire sprinklers operate at a predetermined temperature, utilizing a fusible element, a portion of which melts, or a frangible glass bulb containing liquid which breaks, allowing the plug in the orifice to be pushed out of the orifice by the water pressure in the fire sprinkler piping, resulting in water flow from the orifice. The major reason for the growth of the fire sprinkler market is the increasing investment of companies to safeguard the infrastructure and to reduce the loss of life and property in different applications. Moreover, governments are formulating stringent norms for the installation of fire sprinklers in buildings, which is driving the demand for fire sprinkler services in commercial applications. The penetration level of fire sprinklers in the industrial vertical is also expected to witness a rapid growth as high fire risk is associated with various sectors such as manufacturing, oil & gas, mining, and energy & power. Flammable and combustible materials such as petroleum, crude oil, flammable gases (such as butane), coal, and many others are used in these sectors. As these materials are susceptible to fire, fire sprinkler systems

are being installed in these sectors to prevent fires.
