## Abstracts

The global Automotive Elastomers market was valued at 3972.44 Million USD in 2021 and will grow with a CAGR of 2.87% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Elastomers are unstructured polymers prevailing beyond their glass transition temperatures such that significant motion is possible. Elastomers have very low intermolecular strength, low modulus of elasticity, and high strain of failure as compared to other materials. Carbon, hydrogen, oxygen and silicon monomers link to form the polymer, which eventually forms elastomers. There are two major elastomers used in automotive applications: synthetic and thermoplastic. Automotive elastomers are used in the production of components that need to withstand extreme temperatures such as hoses, insulators, seals, bushes, engine mounts, and gaskets. The tire application is projected to lead the automotive elastomers market during the forecast period. Because of the implementation of stringent environmental regulations regarding emission levels, vehicle design has been changing drastically over the past few decades.
