Bag Filters are air pollution control devices that remove particulate matter from a gas stream by passing the dirty air through a layer of cloth. The particulate matter deposits on the cloth surface and the clean air passes through. Of all the air pollution control technologies, Bag Filters are the predominant particulate removal device used in industrial processes today. The Asian market generally will experience growth well above the rest of the world. The expansion of heavy industry in this region will be substantial. Foundries, steel mills, cement and chemical plants all require investment in fabric filters. In Europe, biomass combustion is the biggest growth market.
