The global Basal Cell Carcinoma Treatment market was valued at 452.23 Million USD in 2021 and will grow with a CAGR of 9% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Basal cell carcinoma has a low metastasis rate and is more benign, so it is also called basal cell epithelial tumor. Based on its greater destructiveness, it is also called invasive ulcer. Basal cell carcinoma is more common in the elderly, and it occurs in the head, face, neck and back of the hand, especially the prominent part of the face. It begins with a small nodule that is skin-to-dark-infiltrated, typically waxy, translucent nodules with high curled edges. The central part begins to rupture, with black necrotic sputum, and the central necrosis spreads to the deep tissue, showing large invasive necrosis, which can reach soft tissue and bone tissue. Among the many treatments, surgical resection is still the most effective treatment for the complete eradication of basal cell carcinoma and avoiding tumor recurrence. In addition to surgical resection, other methods that can be used to treat basal cell carcinoma include: radiation therapy, photodynamic therapy, scraping electrocautery, cryotherapy, topical application of drugs, etc.
