Biodegradable mulch film is a mulching technique wherein waste from use of biodegradable mulching materials is transformed into carbon dioxide, methane, water, or biomass at the end of their shelf life, thereby benefiting the agricultural soil. Biodegradable mulch materials are obtained from plants and animals; thus, these have a lower environmental impact than use of inorganic mulching technique. Asia Pacific dominated the global biodegradable mulch films market and accounted for 66% of the total demand in 2017. China was the leading biofilms consumer in 2017 owing to growing industrialization and urbanization that has led to higher living standards and rise in demand for food products. Growing food demand in the country may be attributed to the high market growth.
