The blood collection tubes for liquid biopsy is a direct-draw tube for the collection, stabilization and transportation of whole blood specimens. It effectively prevents blood coagulation, prevents cell analysis and preserves nucleated cells to enable efficient analysis of cell-free DNA (cfDNA). A blood collection tube which stabilizes nucleated blood cells. The unique preservative prevents the release of genomic DNA, allowing isolation of high-quality cell-free DNA. In recent years, the use of blood vessels for liquid biopsy has maintained a good trend of continuous increase, especially in North America, Europe, China, Japan and other countries. Now it is facing the slowdown of global market growth. Blood vessels used for fluid biopsy are mainly used for IVD and research, of which IVD use accounts for more than 70% and continues to grow.
