The global Body Fat Measurement market was valued at 45.36 Million USD in 2021 and will grow with a CAGR of 7.47% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Body fat analyzers are also known as impedance meters is a tool for accurate assessment of body fat and this identify risk associated with health due to high or low amounts of body fat. Moreover these devices also help assess effectiveness of exercise and nutrition intake and age related ages. Body fat measurement is considered as a common fitness test at gymnasium, health clubs. The body fat measuring device when applied to the skin leads to a passage of weak current between the outer two electrodes. As this high frequency current passes through the skin, the muscles and the subcutaneous fat, some amount of energy is lost due to the tissue resistance. This change in the energy is then measured with the help of two inner electrodes. The body fat measurement devices can be designed to measure the flow at different depths. The Asia Pacific region is expected to post the highest CAGR during the forecast period owing to presence of a large number of BIA device manufacturers. Presence of an increasingly healthcare sensitive population in emerging economies such as India and China is supplementing the growth of the regional market.
