Abstracts

The global Boron Nitride Nanotubes (BNNT) market was valued at 35.35 Million USD in 2021 and will grow with a CAGR of 6.94% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Boron nitride nanotubes (BNNTs) are structurally analogous to carbon nanotubes (CNTs) and possess equally impressive mechanical properties along with a different set of multifunctional properties including higher thermal stability than CNTs, wide band gap, electrical insulation, polarizability, high neutron absorption cross-section, and transparency in the visible region. The global production of BNNTs increased from 117.8 g in 2013 to 35954.9 g in 2018, at a CAGR of 213.99%. The global BNNTs market is valued at 38449.38 K USD in 2017 and is expected to reach 65903.93 K USD by the end of 2025, growing at a CAGR of 6.97% between 2017 and 2025. North America plays an important role in global BNNTs market, especially United States, which has great influence on the development of BNNTs. The industry originated in the United States, and the United States has an absolute market share in the global market. Boron nitride nanotubes reinforced with polymers have been shown to be even stronger than carbon nanotube composite counterparts. Like carbon, boron nitride can form single atom thick sheets that can roll up into cylinders to create nanotubes. Boron nitride nanotubes alone are almost as strong as carbon nanotubes, but their real advantage in a composite material is how strongly they can bind polymers. However, the major

drawback of boron nitride nanotubes is their cost. They sell for about 1100 USD/per gram in 2017, while carbon nanotubes cost between \$10 and \$20 per gram. The main reason boron nitride nanotubes are so expensive is because production volumes are still low. How to improve production efficiency is the key to reducing costs.
