The global Brazing Materials market was valued at 14.76 Million USD in 2021 and will grow with a CAGR of 2.18% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography (North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Brazing is a metal joining process utilizing a filler metal that melts above 840°F and below the melting point of the base metals. The American Welding Society defines brazing as "a group of joining processes that produces coalescence of materials by heating them to the brazing temperature in the presence of a filler metal having a liquidus above 840°F (450°C) and below the solidus of the base metal. The filler metal is distributed between the closely fitted facing surfaces of the joint by capillary action." Brazing then must meet each of three criteria: 1. The parts must be joined without melting the base metals. 2. The filler metal must have a liquidus temperature above 840°F (450°C). 3. The filler metal must wet the base metal surfaces and be drawn into or held in the joint by capillary action. Brazing Materials include powders, pastes, coated-rods, preformed, rings, wire and fluxes. The major filler metal contain silver brazing alloys, Copper brazing alloys, Aluminum brazing alloys, nickel brazing alloys. At present, in developed countries, the Brazing Materials industry is generally at a more advanced level. The world's large enterprises are mainly concentrated in Asia.
