## Abstracts

The global Breast Imaging Technologies market was valued at 299.75 Million USD in 2021 and will grow with a CAGR of 8.91% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Breast imaging technologies are used to obtain high-resolution images of breast tissues. These imaging modalities, such as ionizing and non-ionizing imaging technologies, aid in the early detection and diagnosis of breast diseases, especially breast cancer in women. This market is expected to witness significant growth during the forecast period owing to increase in incidence of breast cancer worldwide and proactive initiatives by healthcare organizations to raise awareness about early breast cancer detection. Moreover, improved reimbursement scenario for breast imaging modalities (such as breast ultrasound and 3D tomosynthesis which helps in the detection of breast cancer in women with dense breast tissue). In addition, launch of technological advanced modalities such as automated whole breast ultrasound system (AWBU) and MBI/BSGI) fuel the market growth. However, high cost of these modalities and stringent regulatory approval processes are expected to impede the breast imaging technologies market industry growth.
