The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Breast pumps are defined as medical devices used for extracting milk from the breast of lactating mothers. Mostly, these devices are used by working women to continue breastfeeding their babies while still at work. In some instances, doctors also recommend women to use breast pumps to stimulate milk supply when the baby is unable to suck milk. Breast pumps have grown as a suitable choice by the working women. The market is expected to witness a notable growth, due to technological advancements, such as double breast pumps, which help to eliminate fat content from milk and substitute it with higher caloric value. The growth of the breast pump market is accredited to inadequate maternity leave period, rapid increase in working women population and rise in awareness about the benefits and significance of breastfeeding. Other important factors, such as technological developments in electric breast pumps, increase in healthcare expenditure by the government, and favorable reimbursement scenario will also help in the market growth. However, high maintenance requirement for electrical battery pumps & hospital grade pumps, and high risk of contamination in open system breast pumps. In addition, high cost of breast pumps along with low awareness, particularly in under-developed countries, such as Afghanistan, Bhutan, and

Nigeria are likely to restrain the industry growth.
