Abstracts

The global Breath Analyzers market was valued at 968.02 Million USD in 2021 and will grow with a CAGR of 14.62% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Breath analyzers are the devices which are used to identify the presence of various compounds in the breath sample of individuals. Breathe analyzer devices are mostly used to measure blood alcohol content (BAC) through an exhaled breath. Breath analyzers are considered as fundamental tool for the detection of drugs, alcohol, tuberculosis, asthma and other diseases. Globally large number of road accident cases are noticed owing to the over consumption of alcohol during driving, breath analyzers are recognized as major equipment in enforcing drink and drive laws. Breath analyzers play an important role in the conviction of DUI offenders. By technology, breath analyzer devices market is segmented into fuel cell technology, semiconductor oxide sensor technology, and infrared absorption technology, fuel cell technology being the dominating segment globally. The development in fuel cell technology has been enhanced by number of factors such as accuracy, portability and reliability of the devices. Fuel cell technology followed by infrared absorption technology which is commonly used for desktop machines for evidential breath analyzers. Breath analyzers can be used by personals as well as by professionals to restrict the drunken individuals from entering in the company premises and other social places. The increasing demand

for breath analyzers has led to the manufacturers introducing several innovations in the product, which is expected to have a positive impact on this market's growth in the coming years. The technology used in breath analyzers has been around for decades, whether it is infrared, semiconductor, or fuel cell sensors. The challenge to reduce the size and processing time of these devices to a minimum, without compromising on the accuracy of the sensor, was met by the evolution of integrated circuits and the miniaturization of electronics. Moreover, some of these breath analyzers can also be connected to a smartphone via microUSB or Bluetooth, allowing the users to track BAC and health conditions using an application on their smartphones. The reduction in size and introduction of nifty features in breath analyzers will lead to their augmented adoption over the next four years.
