Air suspension system is a type of vehicle suspension that uses an air pump or compressor to pump air into the airbag (bellow). These bellows are made from reinforced rubber to allow air pressure to inflate them and thus raise the vehicle body from the axle. A suspension system in a vehicle enables connection between the vehicle body and the wheels and allows relative motion between them. The main components included in the suspension are a system of tires, springs, shock absorbers, and linkages. In 2017, Europe accounted for the largest share in the global bus air suspension system market; China was the second largest market for bus air suspension system, owing to its increasing customer base and high disposable income of people in the region. This has resulted in increased manufacturing activities by local automotive OEMs in the region, and supporting the growth of the bus air suspension system market. In the future, China, Brazil and India will be the important consumption markets of bus air suspension system. In the developing countries, as the rapid development of national economy and continuous improvement of people's living standards, the vehicle population is increasing stably, which brings more opportunities to bus air suspension system Industry.
