Cast film, a non-stretch, non-oriented cast film produced by melt flow quenching. There are two ways: single-layer flow and multi-layer co-extrusion flow. Unlike the blown film process, the cooling of the film with cast extrusion is highly efficient. Cast film production involves a different process. In this case the resin is extruded through a linear die and oozes out onto large diameter chilling rollers. (Note that they may not actually be cold, but rather are much cooler than the semi-molten plastic.) Depending on the original thickness of extrusion, sometimes film is thinned to the target gauge by winding the resulting film faster than it is extruded. The global consumption of Cast Film increases from 2517.28 K MT in 2013 to 3017.26 K MT in 2017, at a CAGR of more than 4.63%. In 2017, the global Cast Film consumption market is led by China and China is the largest region consumption market, accounting for about 33.09% of global consumption of Cast Film.
