Abstracts

The global Cellulosic Ethanol market was valued at 407.75 Million USD in 2021 and will grow with a CAGR of 42.06% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography (North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Cellulosic ethanol is chemically identical to first generation bioethanol (i.e. $\text{CH}_3\text{CH}_2\text{OH}$). However, it is produced from different raw materials via a more complex process (cellulose hydrolysis). In contrast to first generation bioethanol, which is derived from sugar or starch produced by food crops (e.g. wheat, corn, sugar beet, sugar cane, etc.), cellulosic ethanol may be produced from agricultural residues (e.g. straw, corn stover), other lignocellulosic raw materials (e.g. wood chips) or energy crops (miscanthus, switchgrass, etc.). Cellulosic ethanol is considered a "second-generation biofuel," which means that a wide range of materials, including waste, can be used in its production. Cellulosic ethanol is renewable, clean, derived from the most abundant organic compound on Earth, and could lead the country closer to energy independence.
