Abstracts

The global CMP Slurry Filters market was valued at 55.66 Million USD in 2021 and will grow with a CAGR of 4.98% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Chemical mechanical planarization (CMP) is a polishing process used to manufacture wafers for the semiconductor industry. It requires the use of a polishing tool and polishing slurry. The slurry in the tool is delivered to the wafer surface and may contain large particles/agglomerates ($> 1 \mu m$) as a result of shipping/handling issues, drying, and interactions within the slurry distribution systems. These large particles can, in turn, increase the level of defectives (scratches) on the semiconductor wafer surface found after the CMP process has been completed. One of the solutions for decreasing the level of defects caused by large slurry particles is through the use of slurry filtration. For these applications, 0.5 to 5 micron filters are typically used. The industry market is very concentrated. Of the manufacturers, Entegris, Pall and Cobetter captured the top three market share spots in the CMP Slurry Filters market in 2019. Among them, Entegris and Pall combined occupied 87.10% global revenue market share in 2019.
