Chemical mechanical polishing/planarization (CMP) slurries are abrasive materials, also called non-crystalline inorganic oxides, which are dispersed in water blended with other chemicals and used in CMP processes for semiconductors. CMP process is employed in semiconductor manufacturing, where surfaces of wafers are smoothed and leveled with the help of abrasive slurries. This process is critical for precise lithography patterning, and is utilized after every deposition-etch step. CMP slurries are liquid solutions generally composed of high-purity deionized water and a proprietary mix of chemical additives and engineered abrasives that chemically and mechanically interact at an atomic level with the surface material of the IC device. Leading manufacturers in the industry include Cabot Microelectronics, DuPont and Fujimi Incorporated, which accounted for 38.67%, 10.22%, and 8.96% of revenue in 2019, respectively. By region, North America had the highest share of income, accounting for 50.10 percent in 2019.
