CBM refers to methane that is found in coal seams. It is formed during the process of coalification, the transformation of plant material into coal. CBM is also known as virgin coal seam methane or coal seam gas. It is widely considered an 'unconventional' source of natural gas. In the United States, CBM is a valuable resource that accounts for about 5 percent of total U.S. natural gas production annually. CBM is natural gas. CBM is primarily methane - a colourless and odourless gas, found in coal deposits formed over millions of years from fallen trees and other plant matter. CBM also known as onshore 'unconventional' gas has developed into a key fuel source, helping to lower the global carbon emissions.
