### Abstracts

The global Cold Plasma market was valued at 1232.53 Million USD in 2021 and will grow with a CAGR of 8.17% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Cold plasma or non-equilibrium plasma is a plasma which is not in thermodynamic equilibrium, because the electron temperature is much hotter than the temperature of heavy species (ions and neutrals). As only electrons are thermalized, their Maxwell-Boltzmann velocity distribution is very different than the ion velocity distribution.[1] When one of the velocities of a species does not follow a Maxwell-Boltzmann distribution, the plasma is said to be non-Maxwellian. A kind of common nonthermal plasma is the mercury-vapor gas within a fluorescent lamp, where the 'electron gas' reaches a temperature of 20,000 kelvins while the rest of the gas, ions and neutral atoms, stays barely above room temperature, so the bulb can even be touched with hands while operating. The surface treatment segment accounted for the largest share of the market for the polymer and plastic industry. This market segment is majorly driven by the advantages of cold plasma surface treatment, such as increased durability, better hydrophobic properties, higher packing density, better film quality, enhanced coating surface smoothness, and lower cost.
