Computed Tomography is an imaging process that uses special X-ray equipment to create detailed pictures or scans in our body. It also called as Computerized Axial Tomography. Computed Tomography provides a different form of images known as cross sectional images and three dimensional images. These images useful for diagnostic, therapeutic and research purpose. Computed Tomography is widely used to detect small abnormalities, diagnose circulatory system diseases and conditions, blood vessel aneurysm, blood clots, kidney stones, to detect head injuries and internal bleeding and detect abnormal growth of cancer cells. The global computed tomography market is driven by following factors such as increasing the prevalence of cardiovascular diseases, orthopedic disorders and Cancer. Growing the popularity in diagnostic centers and increase demand for high quality of health care delivery. There is advances in digital imaging technology and significance for screening and early diagnosis of chronic cardiovascular diseases and cancer. Increasing global geriatric population, technological advances and growing public awareness on health care are vital driving factors.
