In electrical power distribution, a busbar (also spelled bus bar, or sometimes as buss bar or bussbar, with the term bus being a contraction of the Latin omnibus, 'for all', is a metallic strip or bar (typically copper, brass or aluminium) that conducts electricity within a switchboard, distribution board, substation, battery bank, or other electrical apparatus. Busbar is an electrical conductor that carries large current, especially one that is part of a power distribution system; typically a thick strip, or a tube. Busbars are used to carry substantial electric currents over relatively short distances; their greater surface area (compared to a wire of the same weight) reduces losses due to corona discharge. The material composition and cross-sectional size of the busbar determine the maximum amount of current that can be safely carried. Busbars can have a cross-sectional area of as little as 10 square millimetres (0.016 sq in), but electrical substations may use metal tubes 50 millimetres (2.0 in) in diameter (20 square millimetres (0.031 sq in)) or more as busbars. Global demand of Copper Busbar has maintained steady growth, the growth rate is around 1.5%, and similar to production growth. Copper Busbar major type is OFCopper Busbar and ETPCopper Busbar. Downstream applications field include Industrial Buildings, Commercial Building and Civil Building, these industries

development rapidly, this industries demand for fastener and shaped pieces are constantly increasing, indirectly stimulating the market demand of Copper Busbar, and stimulate the development of Copper Busbar industry.
