Abstracts

The global Crystalline Silicon PV market was valued at 102.65 Million USD in 2021 and will grow with a CAGR of 6.16% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Crystalline silicon PV is made of highly pure silicon wafers that are further used to convert the solar energy into electrical energy. Crystalline silicon (c-Si) is one of the most widely used semiconductor material in photovoltaic (PV) technology to manufacture solar cells. c-Si occupies more than 90% of the total PV market revenue owing to its several benefits such as improved efficiency. The world crystalline silicon PV market is driven by heightened demand of renewable energy and increase in electricity demand, which is further supported by the rise in population globally. Limited availability of fossil fuels and strict government regulations on carbon emission create the strong need for efficient and cost-effective renewable energy sources such as solar energy. Crystalline silicon solar cells are highly efficient as compared to its rival technologies, for instance, amorphous silicon and non-silicon solar cells. However, high initial investment and reduced efficiency of crystalline silicon at very high temperatures restrain the market growth. Technological advancements in the field of solar cells to increase efficiency and rise in government spending on renewable energy projects are expected to provide growth opportunities in the market.
