An x-ray tube is an energy converter. It receives electrical energy and converts it into two other forms: x-radiation and heat. The heat is an undesirable byproduct. X-ray tubes are designed and constructed to maximize x-ray production and to dissipate heat as rapidly as possible. The x-ray tube is a relatively simple electrical device typically containing two principle elements: a cathode and an anode. As the electrical current flows through the tube from cathode to anode, the electrons undergo an energy loss, which results in the generation of x-radiation. The industry`s leading manufacturers are GE, Siemens and Varex Imaging (Varian), which together account for 72.06 per cent of revenues. By region, the Asia-Pacific region has the highest share of income, at around 39.75 percent in 2019.
