CIPP, is one of several pipe rehabilitation methods referred to as Trenchless Technologies. It is an approved method and preferred method to rehabilitating cracked, broken and failed sanitary or storm sewer pipes. Lining is less expensive and more efficient than traditional open cut replacement methods, normally installed with little or no surface disruption. CIPP lining process can be used to rehabilitate virtually any type of pipe including; Clay, Cast Iron, Orangeburg, PVC, ABS, HDPE, Concrete Pipe or Corrugated Metal Pipe. CIPP is a resin-saturated felt tube or robust sleeve composed of polyester that is inverted or pulled into aging and damaged sewer pipes. Typically, the CIPP lining tube is inserted into the damaged pipe with either air pressure or water pressure. Hot water or steam is used to cure the resin which then forms a solid, impregnable mass that lines the interior dimensions of a sewer pipe, taking the form of the pipe and providing a seamless, tight fitting and corrosion-resistant lining.
