The conventional definition of slurry is a mixture of water and small particles of a solid. The particles are not normally suspended in the liquid and are maintained in suspension by agitation during the use of the slurry. Diamond Slurry is that the particles are micron sized diamond particles and the liquid (carrier vehicle) can be oil or water based. Diamond Slurries are used for polishing materials that require a mirror finish. They are often used in metallurgical specimens, carbide dies, carbide seals, spectacle glass industry, semiconductor industry and for polishing diamonds, etc.As for the consumption, Asia Pacific is the largest consumer, who owned 76.52% share in global consumption market in 2019. The follower is North America, accounting for 12.91% sales share in 2019. Production areas mainly include North America, Europe, China, Japan and South Korea. In terms of types, Water Based Slurries occupied the largest sales share of 72.34% in 2019. Although more and more new type materials of Alcohol Based and Oil Based are used to produce Diamond Slurries, Water Based Slurries will remain a leading position for a long time in the future. Based on the application, Metal using constitutes the largest application market for Diamond Slurries. The largest end-use markets for Diamond Slurries are Stainless Steel, Aluminum Alloy, Copper Alloy
