Hemoperfusion is a treatment technique in which large volumes of the patient's blood are passed over an adsorbent substance in order to remove toxic substances from the blood. Adsorption is a process in which molecules or particles of one substance are attracted to the surface of a solid material and held there. These solid materials are called sorbents. Disposable Hemoperfusion is sometimes described as an extracorporeal form of treatment because the blood is pumped through a device outside the patient's body. In this report, we calculate medical consumables of hemoperfusion. Disposable hemoperfusion mainly has two types, which include charcoal hemoperfusion and certain resins hemoperfusion. With medical effect of hemoperfusion, the downstream application industries will need more hemoperfusion products.
