Laparoscopy is a minimally invasive surgical technique performed through a keyhole incision. A small camera along with a light source attached to a tube enables surgeons to manoeuvre special disposable laparoscopic instruments to the target area and carry out the surgery. Disposable laparoscopic instruments including scissors, graspers and dissectors, etc. Disposable laparoscopic instruments are sterilized and individually packed, intended for temporary or one-time use to avoid high risk of cross contamination, surgical site infections, and healthcare associated infections. Primary benefits of disposable laparoscopic instruments include infection control and cannot transmit infectious agents to the specific patients. Disposable laparoscopic instruments or other medical instruments do not need the lengthy process of decontamination or sterilization and saves both time and money for the healthcare centers.
