Abstracts

The global Dissolved Air Flotation Systems market was valued at 10.58 Million USD in 2021 and will grow with a CAGR of 3.11% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Dissolved Air Flotation (DAF) systems are designed to remove suspended solids (TSS), biochemical oxygen demand (BOD5), and oils and greases (O&G) from a wastewater stream. Contaminants are removed through the use of a dissolved air-in-water solution produced by injecting air under pressure into a recycle stream of clarified DAF effluent. This recycle stream is then combined and mixed with incoming wastewater in an internal contact chamber where the dissolved air comes out of solution in the form of micron-sized bubbles that attach to the contaminants. The bubbles and contaminants rise to the surface and form a floating bed of material that is removed by a surface skimmer into an internal hopper for further handling. In consumption market, North America, Europe and Asia-Pacific are the mainly consumption regions due to the bigger demand of downstream applications. In 2017, these three regions occupied 80.64% of the global consumption volume in total. Dissolved air flotation (DAF) systems has different capacities, which include ?20 m³/hour, 20-50 m³/hour and ?50 m³/hour. And each type has different application people and places relatively. With environmental effect of dissolved air flotation (DAF) systems, the downstream application industries will need more dissolved air flotation (DAF) systems products. So, dissolved air flotation

(DAF) systems has a huge market potential in the future.
