District heating (also known as heat networks or teleheating) is a system for distributing heat generated in a centralized location through a system of insulated pipes for residential and commercial heating requirements such as space heating and water heating. The heat is often obtained from a cogeneration plant burning fossil fuels or biomass, but heat-only boiler stations, geothermal heating, heat pumps and central solar heating are also used, as well as heat waste from nuclear power electricity generation. District heating plants can provide higher efficiencies and better pollution control than localized boilers. Key players operating in the district heating pipeline network market include Logstor, REHAU, BRUGG, Isoplus, Perma Pipe, Georg Fischer, Uponor, Aquatherm, Thermaflex, CPV Ltd. These top ten players account for 60% of total market. China market is set to witness significant growth on account of growing funding toward commercial and residential establishments across the nation. Ongoing government initiatives to encourage deployment of energy-efficient systems will further propel the district heating pipeline network market. China is the largest production and consumption region with share over 41%.
