Abstracts

The global Electrolyte Analyzers market was valued at 108.11 Million USD in 2021 and will grow with a CAGR of 5.81% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

Electrolyte analyzers measure electrolyte levels in the human body to detect metabolic imbalances and measure renal and cardiac function. The electrolytes measured include sodium (Na⁺), potassium (K⁺), chloride (Cl⁻) and bicarbonate (HCO₃⁻ or CO₂). Electrolyte analyzers are used in hospital and reference laboratories, and also point of care settings. Most electrolyte analyzers use blood plasma, serum, or urine samples; some analyzers can use whole blood (for faster turnaround time) and cerebrospinal fluid (CSF). Electrolytes are measured using ion selective electrodes (ISE) and colorimetric and photometric techniques. Most electrolyte analyzers are capable of high throughput ranging from 400 to 2400 tests per hour. Products based on other technology are also developed. Dry reagent with Kodak has successfully developed some products in which dry reagent are used. German BM (now Roche Diagnostics GmbH Diagnostics Division) can provide products with enzymatic assay kit. Biosensor products are specific and sensitive. Users do not need to separate blood samples before testing and therefore non-professional staff can master the skills for measurement very quickly for clinical chemistry analysis in recent years. Because of this trend, patients can get measurement in ICU, home or operation rooms in time and their health can be monitored conveniently

and this is called point of care testing (POCT). It can be estimated that a variety of biosensor-based analyzers will be popular in the future and portable, hand-held analytical instruments as well as implantable analyzers will be an important part of POCT. Nowadays, most electrolyte analyzers are based on ISE technology. The main function of electrolyte analyzers is to measure the concentration of electrolyte, such as Sodium ion, Potassium ion, Calcium ion and carbondioxide. However, nowadays electrolyte analyzers become more functional and smart. Some companies, such as American Beckman, Nova, Ciba Corning, Switzerland AVL, Finland Kone can produce electrolyte analyzers which can measure blood gas/kidney function and can measure Ca^{2+} , Mg^{2+} , Li^{+} in the same time. These products have become the leading products in the market.
