The global EMC Filtration market was valued at 394.14 Million USD in 2021 and will grow with a CAGR of 5.03% from 2021 to 2027, based on HNY Research newly published report.

The prime objective of this report is to provide the insights on the post COVID-19 impact which will help market players in this field evaluate their business approaches. Also, this report covers market segmentation by major market vendors, types, applications/end users and geography(North America, East Asia, Europe, South Asia, Southeast Asia, Middle East, Africa, Oceania, South America).

EMC filters become a critical component in the design of most electronic devices. A device which is getting affected by the various EMI sources present in the environment can also act as a source of EMI for other devices at the same time. In order to reduce the amount of interference, EMC standards have been introduced. At present, meeting the EMC standards is a basic requirement for any electrical and electronic device before its placement in the EMC filtration market. EMC filters are available in the market by various load types such as single phase and three phase filters; however, custom filters are also available to meet the specific requirements. An EMC filter must be able to attenuate both common mode and differential mode insertion loss. The application of EMC filters can be either in the components generating asymmetrical interference or in the components generating symmetrical interference. EMC filtration market serves a vast range of industry verticals ranging from very small consumer electronic devices to very large military equipment and very sophisticated medical equipment to very tough automotive parts.
