Fatty methyl ester sulfonates are the derivatives of oils and fats like vegetable oil, palm oil, and coconut oil. These are eco-friendly anionic surfactants that are synthesized by the sulfonation of saturated fatty acid methyl esters. They exhibit high detergency due to the availability of vegetable oils and are used extensively in detergents in the powdered and liquid form. Their raw materials are obtained from renewable and natural resources, because of which they exhibit low toxic effects and are currently used in personal care products. They are readily and easily biodegradable and exhibit lower toxicity compared to petroleum-based detergents. Manufacturers extensively use anionic surfactants such as methyl ester sulfonate as an active ingredient in laundry detergents. It is highly preferred over other synthetic detergents because it has lower level of toxicity. In addition, methyl ester sulfonate is obtained from renewable resources. Furthermore, the fatty methyl ester sulfonate market will continue to witness growth in the detergents segment because the presence of small chain carbon atoms in fatty methyl ester sulfonate makes it highly biodegradable.
