Performance of the livestock highly depends upon their feed intake. The daily feed consumption of livestock is determined by various factors, one of which is the palatability of the feed. The palatability of the feed is positively correlated with the taste experienced by the livestock. This factor can be controlled by selecting appropriate feed palatability enhancers. The important types of feed palatability enhancers include flavors, sweeteners, aroma enhancers, and others. Feed palatability enhancers are gaining tremendous growth in past few years. Feed palatability enhancers are additives added to enhance the taste and quality of the livestock feed. Increasing awareness of animal nutrition and rising concern for animal health is driving the market of feed palatability enhancers.
