A sprinkler head has a two-part metal element that is fused by a heat-sensitive alloy. The link holds the pip cap, or plug, in place. Once the ambient temperature around the sprinkler head reaches a specified temperature, the alloy releases and the metal elements separate, which causes the pip cap to fall away. Water is then released. The main consumption regions are concentrated in the Asia, Europe and North American. The fire sprinkler heads consumption has great relationship with the local economical developed level and currently, the developing countries` grow rate has overcome the developed countries.
